

READ ME

This folder, contains the files needed for the SSIS. You must see 2 packages, one for the creation of the ETL process, and one for the update of the DW-implementation of SCD type 2, named ETL, Update respectively.

You need to run at least one time the package ETL, before running the package Update.

Every task runs through direct input and not through file connection because we wanted to avoid the usage of too many connection managers.

To run the solution all you need to do is to change the connection manager, and add the name of you PC (as connection manager).

The package ETL should run, even if you have run it before.
